# While & Do...While loops

While Loop

- Repeated If Statement

- Condition is checked at loop start

- Loop gets terminated when condition is evaluated to false

Syntax

Test this boolean expression

If the boolean expression is true, perform these statements
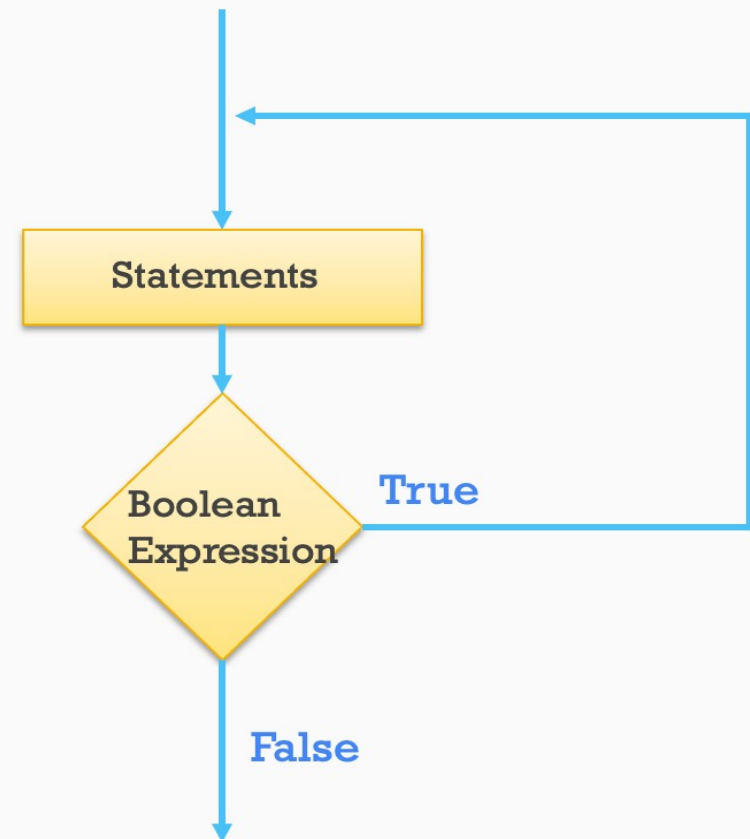

```java
while (number <= 5){

    System.out.println("Hello");
    number++;
}
```

After executing the body of the loop, start over

CYDEO

Do...While Loop

- Repeatedly executes same set of statement while condition is true

- The statement is executed once initially then condition is checked at loop end

- Code in loop body will execute at least once

Statements

Boolean Expression

True

False

CYDEO

Syntax

```
do {

	//Loop Body

	Statement(s);

}while(Boolean Epression);
```

Which Loop to Use?

- You can use a for loop, a while loop or a do-while loop, whichever is convenient.

- A for-loop maybe used if the number of repetition is known in advance

- A while loop may be used used if the number of repetition is not fixed

- A do-while loop maybe used to replace while loop if the loop body must be executed before the condition is checked.
